

Master Programme

Physical Biology of Cells and Cell Interactions (PBioC)

Description of modules for the Master's course

According to the study regulations from 2015

Status: January 2018

The English version is for general information only and not legally relevant.

Overview of Modules:

Compulsory Modules (PM)

- 1 Introduction to the Master Program and Basic Methods in Cell Biology
- 2 Advanced Cell Biology I
- 3 Advanced Cell Biology II
- 4 Current Concepts in Cell Biology
- 5 Advanced Methods in Cell Biology
- 6 Master Thesis

Export Module (EM)

- 7 Module for students from other Masters

Module „Free Studies“

- 8 Module “Free Studies” for Students of the Master PBioC

Elective Modules (Wahlpflicht; WP)

	Module name	Responsible
9	External Practical Module Cell Biology	Head of The Master Degree Program
10	Cell Biology and Physiology of Signal Transfer <i>This module will be terminated in WS 2016/17</i>	Prof. Dr. W. Volkhardt
11	How to make a Neuron: From Stem Cells to Stable Cell Lines. <i>This module will be terminated in SS 2017</i>	*Dr. K. Gampe
12	Neurophysiology of Sensory Systems	Prof. Dr. M. Kössl
13	Auditory Function and Dysfunction: Behavior and Physiology	PD Dr. B. Gaese
14	Information Processing in the Central Auditory System	PD Dr. B. Gaese
15	Developmental Neurobiology <i>This module will be terminated in WS 2016/2017</i>	Prof. Dr. A. Acker-Palmer
16	Physiology and Behavior	Prof. Dr. M. Grünewald
17	Three-Dimensional Cell Cultures and Three-Dimensional Microscopy	Prof. Dr. E.H.K. Stelzer
18	Three-Dimensional Developmental Biology and Three-Dimensional Microscopy	Prof. Dr. E.H.K. Stelzer
19	Three-Dimensional Plant Cell Biology and Three-Dimensional Microscopy <i>This module will be terminated in SS 2018</i>	Prof. Dr. E.H.K. Stelzer

20	Cell Communication, Cell Adhesion and Cell Motility <i>This module will be terminated in WS 2017/18</i>	Prof. Dr. A. Starzinski-Powitz
21	Plant Cell Biology	Prof. Dr. E. Schleiff
22	Fungal Cell Biology	Prof. Dr. H. Osiewacz
23	Function and Evolution of Metabolic Pathways	Prof. Dr. I. Ebersberger
24	Special Aspects of Immunology	* PD Dr. Zoe Waibler
25	Developmental Genetics	Prof. Dr. D. Stainier
26	Cell Biology and Gene Expression Control	* PD Dr. J. Lausen
27	Endothelial Cells and Tumor Cell Biology	* Dr. B. Strilic
28	Principles of Tube Morphogenesis	* Dr. M. Nakayama
29	Developmental Cell Biology	Prof. Dr. V. Lecaudey
30	Basics and Appliace of Image and Data Analysis in Biology <i>This module will be terminated in SS 2018</i>	** Dr. S. Fischer
31	Biology of Extracellular Vesicles	* Dr. S. Momma
32	Special Aspects of Tumor Biology	*** Prof. Dr. K. Strebhardt, Dr. Y. Matthes
33	Cellular RNA Biology	Prof. Dr. M. Müller-McNicoll
34	Neuronal basis of acoustic communication in mammals	**** Dr. Julio Hechavarria
35	Cellular, molecular and systemic Neurobiology in mouse and zebrafish	***** Prof. Dr. A. Acker-Palmer, Bettina Kirchmaier, Franziska Foss
36	Basics of quantitative developmental biology – Analysis of dynamic processes	* Dr. C. Pohl
37	Data analysis, mathematical modeling and simulation	Prof. Dr. F. Matthäus
38	Understanding the molecular mechanisms leading to Parkinson's disease	Prof. Dr. S. Eimer

Note:

* This module will take place under responsibility of the academic director of the Master course.

** This module will take place under responsibility of Prof. Dr. E.H.K. Stelzer.

*** This module will take place under responsibility of Prof. Dr. K. Strebhardt and the academic director of the Master course.

**** This module will take place under responsibility of Prof. Dr. M. Kössl.

***** This module will take place under responsibility of Prof. Dr. A. Acker-Palmer.

MSc PBioC: 1	Introduction into the Master Program and Basic Methods in Cell Biology	Compulsory Module	14 CP (sum) = 420 h		14 SWH
			Contact-studies 14 SWH / 210 h	Self-studies 210 h	
Contents					
<p>The module focuses on 3 parts:</p> <p>1. <u>Introduction to the Master's program</u>: In a two-day seminar, an introduction to the Master's program will take place. Here, the qualification objectives and main research areas of the degree program are presented, i.e. the fields of cell biology and physical biology, research projects of contributing research groups, modules and module supervisors of the Master's program. The intention is to introduce the curriculum of the program and provide students the opportunity to get to know fellow students and university teaching staff.</p> <p>2. <u>Basic Methods in Cell Biology</u>: Another focus of this module is an 8-week practical course on basic and common molecular biological, protein biochemical, immunological, histological, cell biological, microscopy-based physical working methods and techniques as well as an introduction to bioinformatics. They will get to know different bioinformatics databases and their application related to different scientific questions. Methods and algorithms for bioinformatics analyses of large sequencing data sets are taught. The students acquire knowledge on the theoretical background of the different working methods and, after instruction, conduct them under scientific guidance and supervision. The students get an insight into different experimental scientific techniques, their theoretical basics and analysis. The students present and discuss their experimental results in the seminar. After completing this module, students have learned principles and basic methods that they can apply in the subsequent elective modules.</p> <p>3. <u>The third focus of the module is the mediation and education of legal and ethical aspects of biosciences.</u></p> <p>Lectures and seminar cover the topics Animal welfare law, biological and scientific ethics, contents of the embryo protection act, The topics are: animal welfare law, the German embryo protection law, gene technology law, biological safety, safety and operating instructions for S1 laboratories, gene technology safety regulation, bio-substances regulation, rules of good scientific practice, basics in patent law.</p> <p>The theoretical and professional contents of the <u>animal welfare law</u> are taught on three days and correspond to the legal requirements of animal protection: introduction to experimental animal science, legal foundations, ethical aspects of animal experiments, anatomy, physiology, behavior, housing, blood sampling techniques of rats, mice and rabbits, as well as breeding and genetics of laboratory rodents, basics of anesthesia and surgery, pain and anxiety reduction, basics of animal welfare killing, statistics, animal husbandry, health monitoring, hygiene in animal husbandry and writing of an animal test proposal. The participation is compulsory for the students of this Master's program. The completion of this module part is according to the legal requirements of animal welfare.</p> <p>The <u>Genetic Engineering Act</u> requires students to participate in a safety instructions for S1 safety laboratories according to § 12 Abs 2 GenTSV. This contains inter alia: safety regulations in the laboratory, protective measurements, filling in of genetic engineering documents and the behavior in case in incidents in the laboratory.</p> <p>On the subject of Biosafety and Biological Agents Regulation, students are instructed the following topics: regulation on safety and health protection in activities with biological agents, definition of biological agents and their classification into risk groups.</p> <p>Lectures and seminars to the topics: Legal and ethical aspects in Biosciences are compulsory for the students, the participation has to be confirmed.</p>					
Educational Objectives / Competences					
<p>The students will learn to deal independently with the theoretical as well as practical contents of their study and to plan the course of their studies. They learn to find their way in a scientific English-speaking environment, to plan and conduct scientific experiments independently, as well as to critically evaluate experimental approaches according to the rules of good scientific practice. After completing the course, the students should be able to conduct basic molecular, protein-biochemical, immunological, cell biological and microscopy-based research.</p> <p>The students learn how to handle and use databases in bioinformatics. They acquire the competence to select, apply and critically evaluate the appropriate methods for specific scientific questions. When working with genetically modified organisms and handling biological agents, the students gain the competence to comply with the guidelines of operating instructions for genetic engineering and biological agents ordinance.</p> <p>Students acquire the competence that animal experiments can only be planned and conducted under consideration of and in compliance with the animal protection law.</p> <p>After completing the module, students know the legal and ethical aspects in biosciences. They are competent to plan their scientific experiments on consideration of the guidelines and rules of animal welfare law, the German embryo protection act, gene technology law, safety and operating instructions for S1 laboratories, gene technology safety regulation and biological safety as well as rules of good scientific practice and patent law.</p>					
Requirements for Participation					
None					
The module starts in the first part of winter term and is compulsory.					
Recommended Requirements					
Admission or preliminary admission to the Master program, knowledge of English.					
Module Assignment (Studiengang / Fachbereich)				Master PBioC - FB 15	
Applicability to other Course of Study				The module parts legal and ethical aspects in biosciences, animal welfare act, patent law, biosafety and biological agent law, rules of good scientific practice and embryo	

	protection law can be taken from Master programs of the FB 15 as well as the Master in Interdisciplinary Neuroscience.									
Dates and Module Frequency	Annually in the first part of winter term									
Duration	8 weeks (3-4 days / week, full-time)									
Module Responsible	Head of examination board									
Proof of Study										
Proof of Participation	1. Proof of participation: Introduction into the Master's program. 2. Proof of participation in lectures and seminars to the aspects: animal welfare law, the German embryo protection law, gene technology law, biological safety, rules of good scientific practice, basics in patent law 3. Proof of participation in safety and operating instructions for S1 laboratories, gene technology safety regulation (GenTSV), (§12Abs.2GenTSV), bio-substances regulation (BioStoffV)									
Certificate of Performance	Seminar talk of about 20 - 40min Protocol (10-15 pages)									
Forms of Teaching	Practical course, lecture, seminar, practice									
Language	English									
Module Completion Test					Form / Duration					
Module Completion Test consists of:					Examination (60 min)					
		Form	SWH	CP	Semester					
					1	2	3	4	5	6
Lecture		[V]	2	2	X					
Seminar		[S]	1	1	X					
Practical		[P]	11	11	X					
Module Completion Test										
Sum			14	14						

MSc PBioC: 2	Advanced Cell Biology I	Compulsory Module	6 CP (insg.) = 180 h		6 SWH				
			Contact -studies 6 SWH / 90 h	Self- studies 90 h					
Contents									
<p>Lecture series: Selected topics on physical biology of cells and cell interactions, cell biology, physiology, neurophysiology, cell types and their functions, developmental as well as molecular and biochemical principles of the function of various animal and plant cells, mechanisms of signal transmission and development of nerve cells and nerve systems.</p> <p>Seminars are based on the lectures on selected topics of physical biology of cells and cell biology. The students present relevant original publications.</p> <p>Colloquia: Students participate in 7 cell biology / physical biology oriented colloquia at the institute.</p>									
Educational Objectives / Competences									
<p>Students develop a broad interdisciplinary basic knowledge in the fields of cell biology, as well as its application possibilities. Students learn scientific research concepts, are able to link different fields and paradigms in cell biology with another. The student lectures on his/her results in a seminar and is, in this context, competent to process information from original publications.</p>									
Requirements for Participation									
None									
Recommended Requirements									
Basic knowledge in cell biology and physical biology									
Module Assignment (Studiengang / Fachbereich)			Master PBioC - FB 15						
Applicability to other Course of Study			FB 15 Master's courses						
Dates and Module Frequency			Annually, first and second part of winter term						
Duration			2 days per week (90 min lecture and seminar)						
Module Responsible			Head of examination board						
Proof of Study									
Proof of Participation			Participation in seminars and colloquia						
Certificate of Performance			20-30 min presentation in the seminar						
Forms of Teaching			lecture, seminar, colloquia, self-studies						
Language			English						
Module Completion Test			Form / Duration						
Module Completion Test consists of			Examination / 45 min / Content: Topics of the lecture and the seminar						
Advanced Cell Biology I	LV-Form	SW H	CP	Semester					
				1	2	3	4	5	6
Lectures	[V]	4	3	X					
Seminar	[S]	1	2	X					
Colloquia	[Ko]	1	1	X					
Module Completion Test				X					
Sum		6	6						

MSc PBioC: 3	Advanced Cell Biology II	Compulsory Module	7 CP (sum) = 220 h						7 SWH		
			Contact-studies 7 SWH / 110 h			Self-studies 110 h					
Contents:											
<p>Lecture series: Selected topics of cell biology of higher eukaryotes. Contents: Cellular, molecular, physiological, structural and physical principles of development and function of higher eukaryote cells including plants; mechanisms of cell-cell and cell-matrix detection, receptor systems and their ligands, signal transmission, apoptosis, vesicular transport of cells, stem cell concepts and cellular plasticity, tumour biology and plant cell biology. Seminar on the lectures: Selected topics of higher eukaryote cell biology. The students present relevant original publications.</p> <p>Lecture and seminar: Molecular principles of vertebrate genetics Contents: Specific and current concepts of genetic analysis of eukaryotic genes and their products will be discussed here; targeted suppression of genes by homological recombination; functional suppression of genes, phenotype analyses. The students present relevant original publications.</p> <p>Colloquia: Students participate in 7 cell biology / physical biology oriented colloquia at the institute.</p>											
Educational Objectives / Competences											
After completing the module, the students are familiar with the principles in cell biology and their uses. They learn cell biology research concepts on various model organisms and are able to link different subareas and paradigms of cell biology. They will have learned to present and discuss original publications in the form of a lecture.											
Requirements for Participation											
none											
Recommended Requirements											
Basic knowledge in cell biology											
Module Assignment (Studiengang / Fachbereich)					Master PBioC - FB 15						
Applicability to other Course of Study					FB 15 Master's courses						
Dates and Module Frequency					First and second part of summer term						
Duration					2 days per week (90 min lecture and seminar)						
Module Responsible					Head of examination board						
Proof of Study											
Proof of Participation					Participation in seminars and colloquia						
Certificate of Performance					20-30 min presentation in the seminar						
Forms of Teaching					lecture, seminar, colloquia, self-studies						
Language					English						
Module Completion Test					Form / Duration						
Module Completion Test consists of					Examination / 90 min / Content: Topics of the lecture and the seminars: selected topics on higher eukaryote cell biology and molecular principles of vertebrate genetics.						
Advanced Cell Biology II			LV-Form	SWH	CP	Semester					
						1	2	3	4	5	6
Lectures			[V]	4	4		X				
Seminar			[S]	2	2		X				
Colloquia			[Ko]	1	1		X				
Module Completion Test											
Sum				7	7						

MSc PBioC: 4	Current Concepts in Cell Biology	Compulsory Module	15 CP (sum) = 450 h						12 SWH	
			Contact-studies 12 SWH / 180 h			Self-studies 270 h				
Contents										
The module includes a project and a seminar with the aim of teaching students the major theoretical principles of research concept development in cell biology. After familiarisation with the current literature, critical open questions are to be identified and research strategies for solving them are developed. The research concept is to be drafted in the form of an application for third-party subsidy.										
Educational Objectives / Competences										
After completing this module, students are familiar with the development of scientific research concepts and integrating them into third-party funding applications. The students can assess the relevance of different and conflicting theories and research concepts and transfer them into new contexts.										
Requirements for Participation										
Passing the following modules: Introduction into the Master's Program and Basic Methods in Cell Biology (module 1), Advanced Cell Biology I (module 2), Advanced Cell Biology II (module 3) and 2 of the 3 elective modules. Note: This project work can be done in any cell biology working group in the Master's course of the faculty of biosciences, FB 15, Goethe University and is not necessarily linked with the Master thesis.										
Recommended Requirements										
None										
Module Assignmet (Studiengang / Fachbereich)				Master PBioC - FB 15						
Applicability to other course of study				FB 15 master's degree courses						
Dates and Module Frequency				at any time						
Duration				4-5 weeks, full-time						
Module Responsible				Head of examination board						
Proof of Study										
Proof of Participation				none						
Certificate of Performance				Presentation of the research concept (20-30 min) in a seminar						
Forms of Learning				Project, seminar, self-studies						
Language				English						
				Form / Duration						
Module Completion Test				Written research concept of 5-20 pages						
Module Completion Test consists of										
		LV-Form	SWH	CP	Semester					
					1	2	3	4	5	6
	Project work	[Pr]	11	14			X	X		
	Seminar	[S]	1	1			X	X		
	Module Completion Test									
	Sum		12	15						

MSc PBioC: 5	Advanced Methods in Cell Biology	Compulsory Module	15 CP (sum) = 450 h		15 SWH					
			Contact studies 15 SWH / 225 h	Self-studies 225 h						
Contents										
The module consists of an internship and a seminar. The aim is to provide students the essential experimental techniques of the specific field of study intended for the Master thesis. This should be done in a way that the Master thesis can be successfully completed within the available time frame.										
Educational Objectives / Competences										
After completing the module, the students will be familiar with the practical principles related to their Master thesis. The students will be able to efficiently dissect methodical information from publications and the world wide web, to assess the feasibility of methodical approaches and to be able to critically evaluate methods and artifacts.										
Requirements for Participation										
Passing the following modules: Introduction into the Master's Programme and Basic Methods in Cell Biology (module 1), Advanced Cell Biology I (module 2), Advanced Cell Biology II (module 3), Current Concepts in Cell Biology (module 4) and the 3 elective modules.										
Recommended Requirements										
Module Assignmet (Studiengang / Fachbereich)			Master PBioC - FB 15							
Applicability to other course of study			FB 15 master's degree courses							
Dates and Module Frequency			Throughout the year; from the third semester on							
Duration			5-6 weeks							
Module Responsible			Head of examination board							
Proof of Study										
Proof of Participation			none							
Certificate of Performance			Presentation of 20-30 minutes, progress report in the working group							
Forms of Learning			practical course, seminar, self-studies							
Language			English							
Module Completion Test			Form / Duration							
Module Completion Test consists of			Oral examination of 30 min							
		LV-Form	SWH	CP	Semester					
					1	2	3	4	5	6
	Practical	[P]	14	14			X	X		
	Seminar	[S]	1	1			X	X		
	Module completion test: Oral examination									
	Sum		15	15						

MSc PBioC: 6	Master Thesis	Compulsory Module	30 CP (sum.) = 900 h						30 SWH	
			Contact studies 30 SWH / 450 h			Self-studies 450 h				
Contents										
	In their Master thesis, students work on a scientific research question within six months and deepen their knowledge of scientific research methods. This may involve experimental, empirical or analytical work. The results must be summarised in a written Master thesis in the style of scientific publications. The supervisor and a second reviewer evaluate the quality of the performance.									
Educational Objectives / Competences										
	After completing the module, the student is able to deal with scientific questions and problems and to embed the findings gained in the existing literature. The student learns to write papers in a scholarly publication style and to apply and assess modern research methods.									
Requirements for Participation										
	Proof of having gained at least 90 CPs and having passed the module Advanced Methods in Cell Biology (module 5). The Master thesis is usually mentored by a university teacher, provided that he or she regularly hosts compulsory or elective modules in the Master's programme.									
Recommended Requirements										
Module Assignmet (Studiengang / Fachbereich)			Master PBioC - FB 15							
Applicability to other course of study										
Dates and Module Frequency			The dates and frequency are pending							
Duration			6 months							
Module Responsible			Head of examination board							
Proof of Study										
Proof of Participation			none							
Certificate of Performance			30 min presentation of the Master thesis in a seminar in the working group							
Forms of Learning			seminar, self-studies							
Language			English							
Module Completion Test			Form / Duration							
Module Completion Test consists of			Written thesis (the mark will be doubly weighted compared to that/those gained in all other modules).							
		LV-Form	SWH	CP	Semester					
					1	2	3	4	5	6
	Seminar Presentation	[S]		30				X		
	Module Completion Test: Master Thesis	[MA]						X		
	Sum			30						

MSc PBioC: 7	Module for Students from other Masters	Export Module	15 CP = 450 h					15 SWH		
			Contact-studies 15 SWH / 225 h	Self-studies 225 h						
Contents										
<p>The module is an export module and includes an elective module (Appendix 4) and completion of a project on current concepts in the specific subject module chosen. This is intended to ensure applicability to other FB 15 master's degree courses of study.</p> <p>This module specifies the performance required of students from other master's degree courses. Students must elaborate controversial key questions in the subject chosen using important original works and overview articles. Project work is to be written in the form of an overview or summary article the scope of which is agreed beforehand with the academic responsible for the module.</p>										
Educational Objectives / Competences										
Students will be familiarized with the theory and practice relevant to the specific module subject chosen and be able to prioritize current developments and controversies in the same field after completing the module.										
Recommended Requirements										
none										
Special note:										
This module only applies to students of other master's degree courses needing a module lasting half a semester for which 15 CPs are awarded.										
Module Assignmet (Studiengang / Fachbereich)				Master Course of FB 15						
Applicability to other course of study				FB 15 master's degree courses as well as Master in Interdisciplinary Neuroscience.						
Dates and Module Frequency				Annually in winter and summer term.						
Duration				15 SWH						
Module Responsible				Head of examination board						
Proof of Study										
Proof of Participation				none						
Certificate of Performance				Written project work						
Forms of Learning				practical course, seminar, self-studies						
Language				English						
Module completion test				Form / Duration						
Module completion test				As indicated in the module description						
		Form	SWH	CP	Semester					
					1	2	3	4	5	6
	Practical Course	[P]	11	11	X	X				
	Project work	[Pr]	4	4	X	X				
	Module completion test: Protocol, Examination, Written Elaboration									
	Sum		15	15						

MSc PBioC: 8	Module “Free Studies” for students from the Master PBioC	Import Module	11 CP = 330 h		11 SWH					
			Contact-studies 11 SWH / 165 h	Self-studies 165 h						
Contents										
The students get the possibility to choose an elective module from the Master courses of other faculties of the Goethe University.										
Educational Objectives / Competences										
After completing the module, the student will be familiar with the theory and practice of the chosen subject and will be able to assess the current developments and controversies in the subject area.										
Recommended Requirements										
None										
Special note:										
This module can replace an elective module in Appendix 4. It requires the prior approval of the examination board or the academic head of the Master’s programme.										
Module Assignmet (Studiengang / Fachbereich)			Master Course of FB 15							
Applicability to other course of study										
Dates and Module Frequency			Annually in winter and summer term.							
Duration			11 SWH							
Module Responsible			Head of examination board							
Proof of Study										
Proof of Participation			none							
Certificate of Performance			The regulations of the provider of the module apply							
Forms of Learning			practical course, seminar, self-studies							
Language			English							
Module completion test			Form / Duration							
Module completion test			The regulations of the provider of the module apply							
		Form	SWH	CP	Semester					
					1	2	3	4	5	6
	Practical Course	[P]	10	10	X	X				
	Seminar	[S]	1	1	X	X				
	Module completion test: Protocol, Examination, Written Elaboration									
	Sum		11	11						

MSc PBioC: 9	External Practical Module Cell Biology	Elective Module	11 CP = 330 h						11 SWH	
			Contact-studies 11 SWH / 165 h			Self-studies 165 h				
Contents										
The obligatory choice practical teaches the basic methods and techniques in basic cell biological and physical biology science. Students work on some current projects under supervision and present the results in the form of a seminar lecture. They learn how to draft scientific papers by writing a protocol of their results. The module can be offered by the faculties of the Goethe University, of other universities in Germany and elsewhere and by research facilities that are not part of any university.										
Educational Objectives / Competences										
Knowledge of how to perform cell biological or physiological experiments in the basic sciences field. Working out scientific problems against the background of relevant literature.										
Recommended Requirements										
none										
Special note										
Lectures and protocol in English. The module is an external one that can replace an elective module in Appendix 4, especially if performed during an ERASMUS study semester abroad. It requires the agreement of the examination board or the head of the Master's programme. It is co-supervised by a university teacher, who is involved in the Master's programme. The form of test performance required will be advised at the beginning of the respective semester. Aside from ERASMUS studies, there is no claim to perform the External Practical Module Cell Biology as long as practical courses from the Master Physical Biology of Cells and Cell Interactions can be offered.										
Module Assignmet (Studiengang / Fachbereich)				Master Course of FB 15						
Applicability to other course of study										
Dates and Module Frequency				Annually in winter and summer term						
Duration				4-5 weeks, full-time						
Module Responsible				Head of examination board						
Proof of Study				The regulations of the provider apply. If a proof of study is not provided, an internship protocol (10 – 20 pages) must be written as well as a presentation in a seminar on the results has to be given (20 – 30 min).						
Proof of Participation				none						
Certificate of Performance				Protocol, seminar talk on the results of own scientific studies and on the current literature						
Forms of Learning				practical course, seminar, self-studies						
Language				English						
Module completion test				Form / Duration						
Module completion test				Protocol, poster or examination. The regulations of the provider apply. If a grading is not provided by the provider of this module, the protocol will be graded.

Contents					
This module is terminated in winter term 2016/17!					

MSc PBioC: 11	How to make a Neuron: From Stem Cells to Stable Cell Lines.	Elective Module	11 CP (sum) = 330 h		11 SWH
			Contact studies 11 SWH / 165 h	Self-studies 165 h	
Contents					
This module is terminated in summer term 2017!					

MSc PBioC: 12	Neurophysiology of Sensory Systems	Elective Module	11 CP (sum) = 330 h						11 SWH	
			Contact studies 11 SWH / 165 h			Self-studies 165 h				
Contents										
Content: The practical teaches basic electrophysiological conductance techniques and bio-acoustic measuring techniques to investigate the auditory system in laboratory mammals and insects in vivo. The students work on their own projects with supervision, and present their results in the form of a seminar talk. In a further seminar talk they present an original piece of research from the field of auditory neurobiology. They learn how to present scientific work through writing up an appropriate result protocol. The main topics are: physiological properties of nerves in the midbrain and cortex, investigating active sensory amplification mechanisms in the inner ear, psychoacoustic analyses in humans, use of computer/software in evaluating data and generating stimuli.										
Educational Objectives / Competences										
Competence: Familiarity with carrying out electrophysiological experiments, measuring otoacoustic emissions, familiarity with anesthetizing and surgical procedures in animal experiments, application of neuroanatomical techniques, learning how to work on scientific questions based on relevant publications.										
Recommended Requirements										
none										
Special note										
none										
Module Assignmet (Studiengang / Fachbereich)					Master Course of FB 15					
Applicability to other course of study					FB 15 master's degree courses of study with integral part of Module 7 [Module for students from other Masters] as well as Master in Interdisciplinary Neuroscience.					
Dates and Module Frequency					Twice per year in the winter and summer semester, each in the first half; 4 weeks of block practical with seminars.					
Duration:					4-5 weeks, full-time					
Module Responsible					Prof. Dr. M. Kössl, PD Dr. M. Nowotny					
Proof of Study										
Proof of Participation					none					
Certificate of Performance					A seminar talk on the results of one's own experiments and on recent scientific papers (20 – 30 min).					
Forms of Learning					practical course, seminar, self-studies					
Language					English					
Module completion test					Form / Duration					
Module completion test					A protocol of 10-30 pages					
		LV-Form	SWH	CP	Semester

	Practium	[P]	10	10	X	X				
	Seminar	[S]	1	1	X	X				
	Module completion test									
	Sum		11	11						

MSc PBioC: 13	Auditory Function and Dysfunction: Behavior and Physiology	Elective Module	11 CP (sum) = 330 h						11 SWH	
			Contact studies 11 SWH / 165 h			Self-studies 165 h				
Contents										
<p>The practical teaches techniques to determine auditory function and dysfunction in rodents. These techniques can be used to determine effects of pharmacological or behavioral treatments of sensory disorders such as tinnitus or hearing loss. The focus is on behavioral techniques suitable to characterize the disorder rather precisely in comparison to normal functions. All steps that are necessary for a project in the field are taught in this practical: study design, animal handling, control of experimental parameters, pharmacological treatment of animals, and data analysis. The behavioral analysis is paralleled by basic electrophysiological measurements necessary to determine the effects of dysfunction and treatments at the physiological level. The students work on their own projects under supervision and present their results in the form of a seminar talk. The main focuses are: measuring and analyzing behavioral data, performing efficient physiological experiments to determine auditory function, and statistical evaluation methods. Preparation of a potential publication will be the final part of the project. After completion, the individual projects will be presented and discussed in the form of a seminar talk. In a further seminar talk the students will present an original piece of research from the area of cognition and hearing.</p>										
Educational Objectives / Competences										
<p>Familiarity with carrying out well controlled behavioral experiments (animal handling, measuring and analyzing behavioral data, statistical analysis). Performing physiological measurements including electrophysiological recording in minimally invasive preparations. Additional aspects are: introduction to software for data handling, signal processing, and graphical display. Deriving scientific questions from the current literature. Knowledge about the usage and limitations of animal models for neurological diseases.</p>

Contents										
<p>The practical covers the whole range of techniques to investigate brain activity underlying the processing of sensory information in the auditory domain. The focus is on electrophysiological single cell techniques in rodents in the awake and anesthetized preparations. Brain activity is acquired and analyzed with the goal to understand behavioral responses following auditory stimulation. Cognitive aspects (e.g. context-dependence) are taken into account. The students work on their own projects under supervision and present their results in the form of a seminar talk. The main focuses are measuring and analyzing neuronal activity in different configurations of in-vivo recording techniques. The following analysis includes modern techniques of signal processing, efficient handling of larger data sets and statistical evaluation methods. Preparation of a potential publication will be the final part of the project. After completion, the individual projects will be presented and discussed in the form of a seminar talk. In a further seminar talk the students will present an original piece of research from the area of cognition and hearing.</p>										
Educational Objectives / Competences										
<p>Familiarity with carrying out physiological experiments (animal handling, surgery, measuring and analyzing electrical activity at the single neuron level. Combining physiology with neuroanatomical and histological staining techniques. Basic introduction to behavioral control. Introduction to software for data handling, signal processing, statistical analysis and graphical display. Understanding cognitive influences on sensory information processing as an important aspect of context-dependent behavior. Deriving scientific questions from the current literature.</p>

<p>The module teaches physiological bases of behaviour control. Students will work on individual projects that are jointly designed. The techniques taught may comprise cell physiology (patch clamp, calcium imaging, extracellular recording), Neuroanatomy, behavioural experiments (behavioural pharmacology, learning and memory). Model organisms are insects, mainly the honey-bee. Conceptual focusses are: function of ion channels and transmitter receptors, neuromodulation, learning behaviour, olfaction, social behaviour of honeybees.</p> <p>The students will give oral presentations of their results and will create a scientific poster summarizing their experiments. In a second seminar talk they learn to critically present physiological and behavioural articles. Presentations, seminars and posters will be given in English and the students receive detailed feedback on their presentation style as well as on the scientific contents. By writing a protocol in a manuscript style the students get acquainted with preparing a manuscript draft for submission to a science journal.</p> <p>The students will be responsible – under supervision – for the study design, protocolling and analysing the original data. Each step will be developed during the course rather than working after a pre-defined protocol.</p>										
Educational Objectives / Competences										
Planning, conducting and analyzing of behavioral physiological experiments; measuring of ionic currents; behavioural observations and quantifications; neuroanatomical methods. Approaching scientific topics; literature work. Preparing of scientific texts, posters and talks.

			Contact-studies 11 SWH / 165 h		Self-studies 165 h					
Contents:										
<p>This internship teaches the basic concepts of three-dimensional cell biology and modern three-dimensional microscopy. The observation of live biological specimens under physiologically relevant conditions becomes increasingly important in the Life Sciences. Healthy as well as tumor cell lines, primary cells as well as stem cells, are cultivated and analyzed under physiological conditions. These conditions are achieved with organ slices and three-dimensional cellular spheroids by growing them in collagen and many other hydrogels that mimic the extracellular matrix (e.g. Matrigel). Quantitative analyses of living three-dimensional structures requires fast optical sectioning. Confocal microscopy is only useful for relatively thin specimens, because of its slow scanning speed, high photo-bleaching rate and low efficiency in collecting light from thick specimens. Light sheet-based fluorescence microscopy in conjunction with three-dimensional specimen preparation techniques provides a suitable alternative. Students will participate in current research projects of the Stelzer group and are supervised by experienced members. They present their results in an oral presentation and in a written internship report.</p>										
Educational Objectives / Competences										
<p>The student learns the basic concepts of classical two-dimensional as well as three-dimensional cell culture. She or he is aware of several applications of three-dimensional cell cultures and knows, which cell types are used in the Life Sciences. He or she understands the principles of optics in classical microscopy (characteristics of light, resolution, aperture) as well as photometry (energy, power). The student knows the differences between confocal and light sheet-based fluorescence microscopy and is able to estimate the limits of classical light microscopy in dense tissues. She or he masters the formation, isolation and staining of spheroids, cysts, organoids and three-dimensional tissue slices. The student has experience in the preparation of the specimens for different microscopes as well as the acquisition and processing of the images and the analysis of the data. At the end of the module the student presents the results in a written report and a talk</p>

<p>This internship teaches state-of-the-art three-dimensional fluorescence microscopy and respective non-invasive sample mounting techniques. All steps are shown exemplarily in the investigation of insect embryogenesis. For more than a century, insect research has contributed significantly to genetics and developmental biology. The most prominent model organism is the common fruit fly/vinegar fly <i>Drosophila melanogaster</i>. However, over the last years it became apparent that focusing on a few established model organisms is not sufficient to understand the basic principles of insect development in detail. New insect species (emerging model organisms) are established in many laboratories to gain new insights into neglected or even unknown processes. For example, the red flour beetle <i>Tribolium castaneum</i> is used since its embryogenesis deviates substantially from that of <i>Drosophila</i> in many different aspects. Instead of wide field or confocal fluorescence microscopy, we use light sheet-based fluorescence microscopy, which allows us to image individuals for one week. Moreover, the imaged individual survives the procedure. Students will work on current research projects and are supervised by experienced members of the Stelzer group. They present their results in an oral presentation and a written internship report.</p>										
Educational Objectives / Competences										
<p>The student learns the principles of insect model organisms, such as <i>Tribolium castaneum</i>, in developmental biology. He or she is aware of current scientific questions in developmental biology and knows how to handle transgenic organisms. He or she understands the principles of optics in classical microscopy (characteristics of light, resolution, numerical aperture) as well as photometry (energy, power). The student knows the differences between confocal and light sheet-based fluorescence microscopy and is able to estimate the limits of classical light microscopy in dense tissues. He or she understands laboratory cultivation of <i>Tribolium</i> as well as preparation methods for confocal and light sheet-based fluorescence microscopes, in the context of long-term live imaging of <i>Tribolium</i> embryos in toto. The student analyzes the data and understands the basics of scientific image processing and the embryonic development of <i>Tribolium</i>. The interns work under guidance on their own individual project based on the actual research topics of the Stelzer group. At the end of the course, they summarize their results and findings in a protocol and prepare a seminar under the guidance of their advisor.</p>

<p>The practical course teaches basic techniques and experimental concepts of molecular cell biology and special questions of cellular and molecular aspects of plant physiology.</p> <p>Key features are: protein biochemical methods to study protein translocation and dynamics of chloroplasts, including subcellular fractionation, basics in plant cell culturing and transgenic (genetically modified) plants, in vivo and in situ measurement of protein activity and localization including digital image processing.</p> <p>The students will learn the handling of genetically modified plants, plant cell cultures and protoplasts e.g. culturing, passaging and transfection for ectopic expression or knockout of genes. The analysis comprises a broad spectrum of molecular biological and cell biological techniques like PCR, cloning, SDS-polyacrylamide gel electrophoresis, western blotting, immunofluorescence, measurement of protein activity and so on.</p> <p>The students work under supervision on their own scientific project which is leaned on the scientific work of the study group and present their experimental results in form of a seminar lecture. In another lab meeting the students present a recent publication on the field of cellular and molecular plant physiology. By performing a protocol with own scientific results, the students learn to write a scientific paper.</p>										
Educational Objectives / Competences										
<p>Skills taught: Knowledge to isolate plant cell organelles, independent characterization of organelle proteins, sterile working, culturing and transfection of cells, working with the fluorescence microscope and computational evaluation of experimental data and image files, knowledge in the analysis of transgenic plants, independent handling of scientific questions in the context of relevant scientific literature.</p>

Contents:										
<p>The internship teaches principal techniques and concepts for dealing with specific questions on cell biology of fungi. The questions are not exclusively aiming at processes that are relevant for these model organisms, but can be transferred to higher systems (i.e. mechanisms of biological aging processes).</p> <p>The participant receives his or her own project on a current issue. Different approaches in the field of molecular biology are applied. Regularly taught methods include comparative studies of wild-type strains with genetically engineered strains (knock-out and overexpression strains). This approach allows to use various molecular, biochemical and cell biological techniques, to specifically gain insight into molecular regulatory pathways (i.e. signal transduction pathways). The focus is on the following techniques: production and transformation of fungal protoplasts, isolation of mitochondria, respiration measurements, "blue-native" gel electrophoresis, fluorescence microscopy of mitochondrial dynamics, Southern, Northern, Western blot, PCR, protein activity measurements, oxyBlot analysis and <i>in-silico</i> data analysis. At the end of the internship, each student presents his/her work and submits a protocol on the results of the project. In addition, he/she reports on a current scientific publication.</p>										
Educational Objectives / Competences										
The student receives theoretical knowledge on the principal techniques and methods in molecular biological, biochemical and cell biological work. Experience in sterile and microbiological work are useful, but are also routinely taught during the internship. In the practical, the handling of English original literature is learned.

<p>In this practical we will provide an understanding of basic methods and algorithms for the bioinformatics analysis of large datasets. The students will work on problems circling around the functional characterization and evolution of metabolic pathways and functional protein complexes. We will integrate latest high throughput DNA sequencing data into the analysis whenever possible and appropriate.</p> <p>Emphasis will be put on the compilation of novel sequence data sets for analyses, on data mining for complementation of existing data sets, as well as on the bioinformatics methods for comparison and annotation of sequence data. The theoretical foundation of the analyses will be formed by self-reliant literature research in combination with the presentation of a publication from the area of applied bioinformatics. Towards the end of the internship the students will exercise the correct way of presenting scientific results by summarizing their achievements in an oral presentation as well as in written form in a report.</p>										
Educational Objectives / Competences										
Independent conduct of functional annotation of sequences, of bioinformatics annotation transfer and of prediction of functionally equivalent proteins under consideration of evolutionary relation-ships; Ability for management and bioinformatics analysis of large sequence sets; Mining of public databases; Knowledge of relational database systems; Generation and interpretation of phylogenetic profiles; Introduction into independent scientific research on the background of relevant literature.

<p>This practical course offers basic theoretical and experimental knowledge in the area of developmental genetics. Principal areas of research are the development, function and homeostasis of vertebrate organ systems including the cardiovascular system, lung and pancreas. The students take part on ongoing experiments in the laboratory to elucidate the cellular and molecular mechanisms underlying these processes. Their work includes: basic zebrafish or mouse genetics techniques and the handling of a zebrafish or mouse colony, live imaging of zebrafish embryos and larvae, processing of embryos or tissues for in situ hybridization and immunohistochemistry, immunofluorescence microscopy, confocal microscopy, molecular biology, embryological techniques (DNA and RNA injections into zebrafish embryos).</p> <p>The results of the practical course are presented by each student in the form of a written report as well as a talk at the end of the course. The students also take part in the weekly lab meetings where they learn about the ongoing research of all the members of the group. In a Journal Club each student presents a recent publication in the field of their own project</p>										
Educational Objectives / Competences										
<p>Students learn the basic techniques to study cellular and molecular aspects of developmental genetics (as detailed above). By the end of the course they have been in direct contact with zebrafish or mice and learn how to handle a zebrafish or mouse colony. The students are in an international environment and learn how to write and communicate their results in English</p>										
Requirements for Participation										
<p>The students should have a strong interest in developmental genetics. Some theoretical (and preferably practical) knowledge of basic molecular techniques and cell biology is expected.</p>

<p>This practical course offers basic theoretical and experimental techniques in the field of cell-and molecular biology with the focus of the control of gene expression via transcription factors and micro RNA's.</p> <p>The students work in the lab on their own project under scientific advice. Topics of interest are control of gene expression, epigenetics and tumor biology.</p> <p>The students will learn the handling and work with eukaryotic cell cultures e.g. passaging of cells, cell transfection for ectopic expression and knockdown of proteins. In addition basic molecular techniques e.g. PCR, molecular cloning, SDS-PAGE and Western Blotting will be performed.</p> <p>The students will learn to document their results in a lab book. The results of the practical course are presented by every student on the form of a written protocol and a talk at the end of the course. The students also take part on the weekly lab meetings where they learn about the ongoing research of all the members of the group. In a Journal Club every student presents a recent publication on the field cell biology in context of their own projects.</p>									
Educational Objectives / Competences									
Students learn the basic techniques for cellular and molecular biology (as detailed above). They will get practical experience in sterile working with eukaryotic cells. At the end of the course they will be able to work with cell cultures for further analysis. Students will be familiarized with scientific literature and learn how to write, communicate and present their results in English.

This training aims at teaching theoretical knowledge and practical experience in the fields of cellular and molecular biology, more specifically in the fields of endothelial and tumor cell biology. The student(s) will participate in ongoing projects in the lab, including the possibility to work on mice as model organism (depending on the project and availability- under supervision). The student(s) will also participate in regular meetings, and the obtained data will be summarized in a written protocol. The lab-atmosphere is international.										
Educational Objectives / Competences										
This training aims at learning different techniques from the above-mentioned fields, including cell culture of cell lines and primary cells, siRNA-mediated knock-down of genes, preparation of histological sections including staining, confocal microscopy and image analysis, PCR, Western blots, immunoprecipitation, etc.										
Requirements for Participation

Contents:										
In this course, we will offer you the opportunity to learn basics of the theory and experimental techniques in cell biology, biochemistry and physiology. The course is especially focusing on tube formation processes during vascular and kidney epithelial morphogenesis. The students will be involved in ongoing projects in the laboratory to address molecular mechanisms underlying these processes. The work includes: molecular cloning, basic protein purification, gel electrophoresis, western blot, cell culture of both primary cell and established cell line, immunohistochemistry using cultured cells and tissues, genotyping of transgenic mice, isolation of mouse tissue, immunofluorescence and confocal microscopy observation.										
Educational Objectives / Competences										
In the journal club you will present a recent paper. In the end of the course, you will have an opportunity to present your progress during the course. You will work in a very international environment. All of the communication is in English.

<p>The practical course offers basic theoretical and experimental knowledge in the area of developmental cell biology. Principal areas of research are the mechanisms underlying cell migration and morphogenesis during organ formation using the zebrafish. Our main model system is the lateral line, a sensory system present in fish that derives from a group of cells that migrate in a collective manner. The students take part in ongoing experiments in the laboratory to elucidate, for example, the mechanisms underlying cell migration, cell differentiation, cell shape changes or cell proliferation in this system. The techniques used include basic genetics techniques, molecular biology, in situ hybridization and immunohistochemistry as well as handling zebrafish (crossing, injection, genotyping) and confocal and live imaging.</p> <p>The results of the practical course are presented by every student on the form of a written protocol and a talk at the end of the course. The students also take part on the weekly lab meetings where they learn about the ongoing research of the members of the group. In a Journal Club every student presents a recent publication on the field of their own projects.</p>										
Educational Objectives / Competences										
Students learn the basic techniques of molecular and developmental biology including zebrafish handling and modern live imaging techniques as detailed above. By the end of the course they have been in direct contact with mice and learn how to handle a mouse colony. The students are in an international environment and learn how to write and communicate their results in English.

This module is terminated in summer term 2018 and is replaced by module 37!					

MSc PBioC: 31	Biology of Extracellular Vesicles	Elective Module	11 CP (sum) = 330 h						11 SWH	
			Contact-studies 11 SWH / 165 h			Self-studies 165 h				
Contents										
<p>Extracellular vesicles are released membrane vesicles from all cells which contain functional proteins as well as nucleic acids. The communication between cells via extracellular vesicles is a relative new and complex field of research.</p> <p>In the practical course the students will get an introduction to extracellular vesicles.</p> <p>Main points are the aspects of purification, classification, analysis of RNA-Protein content as well as visualization and transfer analysis of functional molecules between cell populations in vitro and in vivo.</p> <p>The students will work with different cell culture techniques, immunofluorescence microscopy, flow cytometric analysis and other related techniques.</p>										
Educational Objectives / Competences										
The students will get knowledge and first experience in the field of Biology with extracellular vesicles and the communication via extracellular vesicles. They learn basic techniques to work with vesicles and they will learn to analyze the biological function. Students will be familiarized with scientific literature and learn how to write, communicate and present their results in English.

<p>The practical course gives a basic insight into experimental techniques and concepts of molecular tumor biology and to special scientific questions to cell cycle regulation and the function of protein kinases in tumor cells. The students will work under supervision on their own scientific project, which is leaned on the scientific work and ongoing experiments of the working group. Experimental educational objectives of the internship are the handling of tumor cells, culturing, passaging and transfections of tumor cells with expression plasmids. A main focus of the working group is the generation, planning and implementation of knockdown (RNAi)- and knockout (CRISPR/Cas9-Genome Editing, Homologous Recombination)- in cells and model systems in tumor research. Ongoing experiments and analysis include techniques of molecular biology, PCR, DNA cloning, SDS-PAGE, Western Blotting, Co-Immunoprecipitation, Kinase Assays, and Time-lapse experiments with established cell lines in culture. In addition the interaction of tumor proteins in cell lysates will be characterized by Mass-Spectrometry. Animal models (Xenograft, transgene tumor models) will be used for in vivo-questions. The experimental results will be presented by each student in a seminar at the end of the internship.</p>										
Educational Objectives / Competences										
<p>The results of the practical course are presented by every student on the form of a written protocol and a talk at the end of the course. The students also take part on the weekly lab meetings where they learn about the ongoing research of all the members of the group. In a Journal Club every student learns to presents a recent publication on the field of tumor biology and in context of their own projects.</p>

<p>In the practical course basics in RNA Biology and animal cell culture will be learned. The students will learn and perform the analysis of RNA expression and RNA-protein-interactions in cells. The students will work under supervision on their own scientific project which is leaned on the scientific work and ongoing experiments of the working group of AK Müller-McNicoll. The experimental results will be presented in a seminar and in form of a graded protocol. During the practical course the students learn to work with different eukaryotic cell lines, the production and transfection of siRNAs to knockdown specific proteins of interest, the purification of RNA-binding proteins from cells and the identification and quantification of bound RNAs via quantitative RT-PCR or other methods.</p> <p>Other techniques comprise immunofluorescence microscopy, PCR, western Blotting, DNA-cloning, mutagenesis of proteins, subcellular fractionation and differentiating of cells.</p>										
Educational Objectives / Competences										
<p>Students will be familiarized with scientific literature; will have additional knowledge in RNA biology and special methods of transcript analysis.</p> <p>They will get practical experience in sterile working with cells and their analysis. At the end of the course they will be able to work with cell cultures for further analysis. They learn how to write, communicate and present their results in English language.</p>										
Requirements for Participation										
none										
Recommended Requirements										
As a basic knowledge, the theoretical foundations of molecular techniques and cell biology are expected. English language skills are required as all laboratory and literature seminars are held in English.

MSc PBioC: 34	Neuronal basis of acoustic communication in mammals	Elective Module	11 CP (sum) = 330 h						11 SWH	
			Contact studies 11 SWH / 165 h			Self-studies 165 h				
Contents										
<p>The main goal of this course is to understand how mammals communicate using acoustic information (sounds). The course is designed from the perspective of the "broadcaster-receiver" approach, and therefore it is consequently subdivided into two parts. The first part is meant for understanding the sounds broadcasted by two mammalian species (Mongolian gerbils and bats) while they are communicating. Basically, using bioacoustics tools, the students will try to figure out the vocal alphabet of bats and gerbils. The second part of the course deals with the receiver. In this part, the students will learn how the gerbil's voice is processed in the brain by neurons located in the auditory cortex. The main aim here is to assess what happens in the brain when an animal hears a behaviorally relevant sound. At the beginning of each course part, there will be introductory discussions that will provide the students with the necessary theoretical background for conducting and understanding the different experiments. An introduction to statistics and to MATLAB will also be offered. The final report will be written in the form of a scientific paper, and the results will be presented in the form of a short talk.</p>										
Educational Objectives / Competences										
<p>By the end of the course, the students should be able to: (1) Understand basic concepts of bioacoustics such as the sound as a mechanical wave, sound transduction using microphones, analog-to-digital conversion using sound cards. (2) Measure basic parameters of a sound wave (frequency, duration, intensity). (3) Perform basic surgeries required for acquiring neuronal data. (4) Understand basic neuroscience concepts such as: action potential, local field potential, receptive field, brain topography, spike clustering, brain oscillations. (5) Testing hypothesis using basic statistical tests (normality tests, parametric and non-parametric t-tests and analyses of variance (ANOVA)).</p>

			Contact study 11 SWH / 165 h		Self-study 165 h			
Contents								
<p>The practical course offers basic theoretical and experimental knowledge in the area of cellular, molecular and systemic neurobiology in mouse and zebrafish. The students work on their own projects under supervision and present the results in the form of a seminar talk. In a second seminar talk they present an original publication from the field of their projects. By writing a result protocol, they will learn how to write scientific reports.</p> <p>The practical course is divided in two units. The first part includes the following tasks: basic mouse genetic techniques, processing of brain tissue for immunohistochemistry, basic techniques of working with neuronal cell cultures, immunofluorescence microscopy, confocal microscopy, and biochemical techniques including protein gel electrophoresis and Western blotting. In the second part of the practical course, the students will be introduced to basic zebrafish genetics using methods in molecular biology and histological techniques, confocal microscopy and brightfield microscopy as well as zebrafish embryo manipulation and basic behavioral tests.</p>								
Objectives								
<p>Students learn the basic techniques for studying cellular, molecular, and systemic neurobiology (as detailed above). They work with cultured cells under sterile conditions, with the epifluorescence microscope and the stereo microscope. The students will be trained in zebrafish embryo handling and basic genetic techniques, and quantify and analyse the obtained data and images. The students are in an international environment and learn how to write and communicate their results in English.</p>

Contents										
<p>In this course, students will learn basic principles and methods of quantitative developmental biology using the embryonic development of the model organism <i>C. elegans</i>. To identify cellular mechanisms underlying animal development through light microscopy, data of sufficient spatio-temporal resolution are crucial, especially to perform automated image analysis and statistically sound models. Each participant will work on a project that focuses on a dynamic phenomenon in developmental biology based on which students will learn to perform quantitative analysis. The phenomena and processes will include polarization, asymmetric cell division, and cell migration. By investigating these processes, students will learn how to cultivate laboratory model animals, how to interfere with gene expression, how to dissect embryos, and how to prepare them for long term, high resolution microscopy. Subsequently, student will learn how to use image analysis tools to obtain statistically relevant quantitative data. For this step, we will use ImageJ or Matlab software. The results of the elective module will be presented in a protocol (graded) and a talk.</p>										
Educational Objectives / Competences										
<p>In this elective module the student will learn fundamental principles of quantitative developmental biology, especially, how to correctly use modern confocal light microscopy, how to perform image analysis with software and how to present the data obtained from the analysis. Moreover, the elective module will enable the student to apply the newly acquired knowledge to future problems in cell and developmental biology, for instance, to choose the right microscopy parameters for a given problem and specimen as well as to know how to incorporate aspects of time scale and spatial resolution. Finally, students will learn statistical methods to properly evaluate microscopy data.</p>

			Contact-studies 11 SWH / 165 h			Self-studies 165 h				
Contents										
<p>This module provides a foundation of theoretical biology in the form of individual student research projects, mainly based on examples of cell migration. Methods and techniques, which are hereby acquired and applied, range from data or image analysis (such as segmentation, tracking, dimension reduction of large data sets, or network analysis), to the modeling and simulation of motile cells. Examples of projects involving modeling and simulation are collective migration (of cancer cells or in developmental processes), chemotaxis, pattern formation, or the description of chemical or mechanical regulatory mechanisms of motility. Alternatively, data analysis, modeling or simulation can be carried out based on a project providing suitable data collected during a previous module.</p> <p>Image analysis will mostly be carried out using conventional software tools (ImageJ, Matlab). For post-processing of the data, visualization or statistical analysis the student will be supported in the generation of own software. The students may code in the programming language of their choice. For beginners, an introduction to programming (in Python, Matlab or Julia) is provided. Also modeling and simulation will involve the generation of code. The topic and results of the research project will be presented in the group seminar. In addition, every student will submit a protocol comprising 10 – 30 pages..</p>										
Educational Objectives / Competences										
The goal of the module is to provide and extend programming skills, data analysis methods and modeling approaches for dynamical or spatio-temporal processes, or large data sets. Students should be able to apply these methods/approaches in their future research and use them as a foundation for further development. Independent research, usage of original literature, and scientific writing will be strengthened.
